Master's Thesis

Presented to the
Department of Economics at the
Rheinische Friedrich-Wilhelms-Universität Bonn

in partial fulfillment of the requirements for the degree of

Master of Science (M.Sc.)
in Economics

Supervisor:
TODO

Submitted in TODO by

2.4	Weak-Identification-Robust Inference	1
2.5	High-Dimensional Nuisance Estimation and Double Machine Learning	1
2.6	DML-IVQR and the Research Gap	1
3	DML-IVQR Methodology	2
3.1	Structural Quantile Model	2
3.2	Profiled Nuisance Parameters	2
3.3	Neyman-Orthogonal Score	2
3.4	Nuisance Estimation and Regularization	2
3.5	Oracle-GMM, Full-GMM, and DML-IVQR	2
3.6	GMM Criterion, Point Estimation, and Robust Inference	2
4	Monte Carlo Design	2
4.1	Baseline Data-Generating Process	2
4.2	Instrument-Strength Extension	2
4.3	Simulation Design	2
4.4	Performance Measures	3
4.5	Confidence-Region Construction and Numerical Grid	3
4.6	Post-Main Numerical Diagnostics	3
5	Monte Carlo Results	3
5.1	Instrument-Strength Calibration	3
5.2	Point-Estimation Performance	3
5.3	Confidence-Region Informativeness	3
5.4	Power	3
5.5	Coverage and Size	3
5.6	Heterogeneity Across Quantiles	3
5.7	Synthesis Across Estimators	3
6	Discussion	4
6.1	Main Findings and Weak Identification	4
6.2	Inferential Validity versus Informativeness	4
6.3	What DML Can and Cannot Address	4
6.4	Limitations	4

7 Conclusion	4
References	5
A Full Monte Carlo Results	A-1
B Detailed Power Results	A-1
C Boundary and Grid-Domain Diagnostic	A-1
D Coverage Forensic Audit	A-1
E Additional $W_N(a)$ Profiles	A-1
F Implementation and Reproducibility	A-1

1 Introduction

1.1 Motivation and Research Problem

1.2 Research Question and Contribution

1.3 Structure of the Thesis

2 Econometric Background and Related Literature

2.1 Quantile Treatment Effects and Endogeneity

2.2 Instrumental Variable Quantile Regression

2.3 Identification and Weak Identification in IVQR

2.4 Weak-Identification-Robust Inference

2.5 High-Dimensional Nuisance Estimation and Double Machine Learning

2.6 DML-IVQR and the Research Gap

3 DML-IVQR Methodology

3.1 Structural Quantile Model

3.2 Profiled Nuisance Parameters

3.3 Neyman-Orthogonal Score

3.4 Nuisance Estimation and Regularization

3.5 Oracle-GMM, Full-GMM, and DML-IVQR

3.6 GMM Criterion, Point Estimation, and Robust Inference

4 Monte Carlo Design

4.1 Baseline Data-Generating Process

4.2 Instrument-Strength Extension

4.3 Simulation Design

4.4 Performance Measures

4.5 Confidence-Region Construction and Numerical Grid

4.6 Post-Main Numerical Diagnostics

5 Monte Carlo Results

5.1 Instrument-Strength Calibration

5.2 Point-Estimation Performance

5.3 Confidence-Region Informativeness

5.4 Power

5.5 Coverage and Size

5.6 Heterogeneity Across Quantiles

5.7 Synthesis Across Estimators

6 Discussion

6.1 Main Findings and Weak Identification

6.2 Inferential Validity versus Informativeness

6.3 What DML Can and Cannot Address

6.4 Limitations

7 Conclusion

References

Appendix A Full Monte Carlo Results

Appendix B Detailed Power Results

Appendix C Boundary and Grid-Domain Diagnostic

Appendix D Coverage Forensic Audit

Appendix E Additional $W_N(a)$ Profiles

Appendix F Implementation and Reproducibility

Declaration

I hereby declare that I have written the present thesis independently and have used no other sources and aids than those indicated, that the submitted work has not been previously presented for examination at another university, and that it has not been published either in whole or in part. I have identified all direct quotes and paraphrased ideas taken from other works in each individual case.
